

BINOCULARS EL42 SWAROVISION

SWAROVISION – OPTICAL QUALITY REDEFINED

The revolutionary SWAROVISION TECHNOLOGY from SWAROVSKI OPTIK enables an image quality in the new EL 42 previously unequalled in binoculars. The combination of field flattener lenses and HD optic ensures impressive image resolution over the entire field of view. Thus providing outstanding contrast even when observing at dusk. Eyeglass-wearers also benefit from the full wide-angle field of view due to the large eye relief distance.

FIELD FLATTENER LENSES – CONTRAST RIGHT UP TO THE IMAGE EDGE

The image focus of the new EL 42 has never before been achieved in any binoculars. The field flattener lenses used produce a virtually flat image. As a result, even the finest structures and smallest details are reproduced with razor-sharp clarity right up to the image edge. For the first time ever, the observer obtains a perfect image with no annoying distortions. The outstanding image quality over the entire field of view means less refocusing and allows you to identify every detail at lightning speed. The observer's peripheral vision will be able to see small movements and identify colors and patterns at the edges of the image with greater ease.

HIGH-DEFINITION – FOR MAXIMUM CONTRAST

The fluoride-containing HD lenses minimize color-fringing (chromatic aberration) for contrast-rich images with razor-sharp outlines. As a result, significant improvements in resolution and contrast are achieved by comparison with conventional grades of glass. Experience completely new insights into nature's world of shapes and colors.

GREATER EYE RELIEF – 100% FIELD OF VIEW FOR EYEGGLASS-WEARERS

The new EL 42 stands out by comparison with other binoculars due to a larger eye relief of the exit pupil. This enables even eyeglasswearers to survey the entire wide-angle field of view and enjoy the new EL's unique edge sharpness. The removable twist-in eyecups are individually adjustable in three stages. In addition to the maximum position (completely twisted out) and the setting for eyeglass-wearers (completely twisted in), the eyecups also have a snap-in intermediate stage.

OPTIMIZED COATING – FOR MAXIMUM COLOUR FIDELITY

The enhanced coatings of the lenses and prisms (SWARODUR, SWAROTOP, SWAROBRIGHT) in the new EL guarantee absolutely lifelike color reproduction and outstanding image brightness for spectacular observation experiences even at dusk. The SWAROCLEAN coating on the outer surface of the lens ensures a non-stick effect with obvious cleaning advantage in the case of dirt such as water marks, insect repellents and tree resin.

EL32

The EL 32 can be carried effortlessly for long periods due to its low weight and due to the user-friendly compact construction it not only sits extremely well in the hand but also fits in almost any outdoor coat. It is also impressive due to its particularly outstanding observation qualities at short distances. The EL 32 is exceptionally well suited to observation at close quarters due to its sensational close focus setting of only 7 feet.
